Area - 338 acres	Temperatures
	Surface - 69 ⁰ F.
Maximum depth - 41 feet	41 feet - 57 ⁰ F.

Principal Fishery: Largemouth bass, Smallmouth bass, White perch.

North Pond is the eighth body of water in a series of lakes flowing south in the St. George river drainage. A brown trout program was first initiated in 1968 and seized in 1999, for the time being, do to the lack of sufficient returns and poor water quality during the summer months. The sea run alewife population should contribute as a stable forage base in the summer months to the warm water fish populations.

There are two unimproved access points on North Pond. One is available at the outlet via dot turnout on the Western road; the other is an unimproved launching facility at a private campground at the southern end of the pond via route 1.
